

SWIVEL JOINTS

Hygienic/Clear Bore Applications

Rotaflow manufacture a range of swivel joints for customers facing the problems of fluid transfer where a clear bore is essential to avoid the problems associated with restriction of flow.

Designed in a wide range of sizes in both carbon steel or 316 stainless steel (together with the more specialist materials) and using a variety of seal and lubrication materials, the clear bore ($\frac{1}{4}$ " - 6" and above) is ideal for the following applications:-

Food or pharmaceutical industry working under hygienic conditions.

As all swivel joints consist of at least two separate parts - one moving within the other, the slight catchment area where the two sections meet has always been considered a problem. Rotaflow have solved this problem with the insertion of a PTFE washer, completely filling the catchment area.

Seal replacement kits are readily available and contain all that is required to completely refurbish the swivel joint on-site.

For technical advice regarding compatibility of materials, temperature and choices of hygienic end fittings please contact the sales office at Rotaflow.
